

Pulverlackering

Vad är pulverlackering?

Pulverlackering kallas även för pulvermålning.

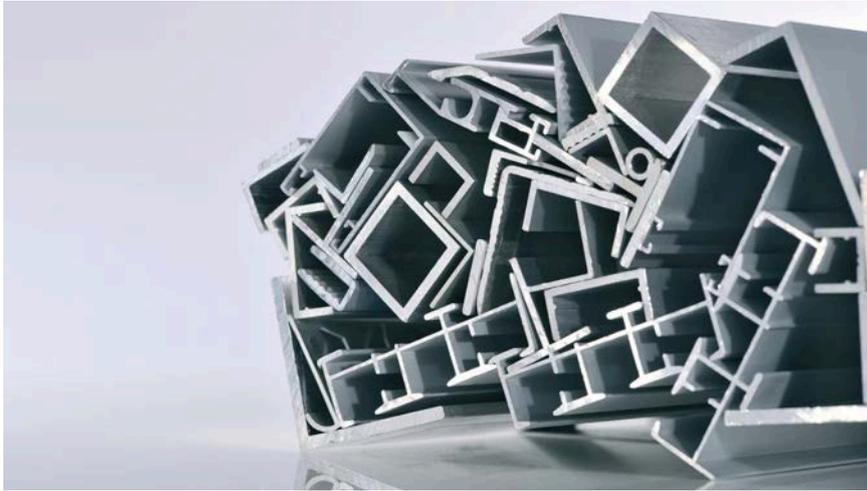

Det är en elektrostatisk process där tryckluft med negativt laddat pulver sprutas på ett positivt laddat underlag (substrat). Underlagsmaterialet måste rengöras och avfettas noggrant innan det kan sprutas. Efter att pulvret har sprutats på, fäster det tillfälligt vid materialet, som sedan placeras i en ugn där pulvret smälter eller struktureras. Pulvret smälter under extrem värme (180 -200 grader) och fäster jämnt vid materialet. Efter att det har svalnat bildas en mycket stark, stöt- och nötningsbeständig beläggning.

Pulverlackering är en hållbar och ekologisk lösning.

Inga lösningsmedel eller förtunningsmedel används, vilket innebär att inga skadliga ämnen frigörs under pulverlackeringsprocessen.

Anodisering

Vad är anodisering?

Denna teknik kräver att aluminiumprofilerna först avfettas och rengörs innan de genomgår en elektrolysbehandling i ett kemiskt bad. Denna konstgjorda oxidering öppnar porerna i profilerna. Därefter färgas profilerna i ett metalloxidbad. Slutligen stängs porerna igen i ett speciellt ångbad.

Med anodisering förblir strukturen på aluminiumets ursprungliga yta oförändrad, den blir bara slätare och färgad.

Den vanligaste anodiseringsfärgen för utomhusnickrierier är en naturlig färg av anodiserat grått, även kallad *naturanodiserad*.

Det är ingen kvalitetsskillnad mellan lackering och anodisering. Den enda skillnaden är rent estetisk. Vid lackering täcks aluminiumytan med ett skikt, medan vid anodisering bevaras aluminiumets ursprungliga textur.

Observera! Det kan förekomma minimala färgskillnader per sats som behandlas med samma färg.

Alla färger i denna färgkarta är tillgängliga utan extra kostnad.
